How do i adjust the pressure on my craftsman pressure washer

You can use a pressure washer to clean nearly anything outside in a fraction of the time it would take you otherwise. However, before you start dreaming about your next cleaning project, learn more about how to choose a unit, what you need and how to use a pressure washer.Types of Pressure WashersWhen you’re shopping for pressure washers, you’ll find two basic types: electric and gas. Electric pressure washers, which you power by plugging them into an outlet. That can limit where you use the pressure washer. Additionally, while they can be powerful, electric pressure washers are typically best for cleaning smaller items, including grills, patios and bicycles. People often like these types of pressure washers because they’re quiet, lightweight, portable and low maintenance.Gas pressure washers require that you buy gas or oil to power the machine. However, that also gives you the freedom to go just about anywhere with it. Although gas pressure washers are heavier than electric ones, they usually have wheels to help you maneuver them. Additionally, they require regular maintenance, but they’re more powerful and last longer than electric models.How Pressure Washers WorkNo matter whether you choose an electric or a gas-powered pressure washer, the machine works pretty much the same way. The motor or engine operates a pump. That pump pressurizes water from the hose up to 1,000 pounds or more before forcing it through the spray wand. The higher the pressure the washer puts out, the stronger its cleaning power. The pressure is measured in pounds per square inch (psi). While many of the smaller washers come with one adjustable nozzle that lets you switch from a single stream to a fan-shaped spray, larger units may come with different nozzles, including some that rotate, create wider or narrower patterns and turbo-charge the stream.What Not to Pressure WashPressure washers are effective in removing flaking paint, stuck-on grime, mold, algae, mud and more. Using a pressure washer on surfaces like patios, decks, driveways, masonry, siding and brick is perfectly safe. However, some materials can’t hold up to the powerful pressure. Examples include: Asphalt roofs: Using a pressure washer on your asphalt roof destroys it by removing the granules Antique items: Very old furnishings, old decking and antique buildings could all have dry rot or soft spots that your pressure washer will likely damage Stained wood: Pressure washing stained wood surfaces will remove the stain from the wood, requiring you to re-stain it after it dries Tips for Pressure WashingGetting started is a matter of powering up the machine and hooking it up to your garden hose and tightening all the connections to prevent air from getting into the lines. Tips for using your pressure washer include: Wash vertical surfaces like siding from the bottom up, then rise from the top down Use the lowest pressure nozzle with the broadest spray pattern to avoid damaging the surface you’re cleaning Avoid spraying into outlets, vents or air conditioning units Pressure Washer TroubleshootingAlways keep your pressure washer repair manual after buying one. Not only will it offer helpful tips for operating it safely, but it also will give you information like the model number, which you might need to get pressure washer repair parts. It also helps to keep pressure washer spare parts around for small fixes. For example, if you’re having trouble starting it, you might need to replace the spark plug or clear out the fuel tank to remove debris before refueling.In many instances, you might not need parts. Instead, you might need to check things out. For example, if your pressure washer is leaking, check the O-rings and water seals, but it might be as simple as loose fittings, which are the most common cause of leaks. If you’re having pressure problems, make sure your garden hose is the right size and is free of any kinks or leaks. MORE FROM QUESTIONSANSWERED.NET A pressure washer uses highly pressurized water to remove dust, dirt, stains, grease marks, and more from your outdoor areas. You can use it for cleaning sidings, driveways, garage floors, patios, and much more. The high-pressure washer is an excellent choice for many jobs. A power washer also uses pressurized water for cleaning. But the main difference between the two is that the power washer uses hot water. That makes the cleaning even more effective and quick. They are an excellent choice for hard surfaces with tough stains and large areas. How to make a pressure washer more powerful: In general, a pressure washer can be made more powerful by using a different nozzle. Other options are changing the pressure regulator or under loader valve, use a different gas type, or optimizing the gas engine. For maximum power, use a red 0-degree nozzle. Nozzles determine the angle of the output water stream. A wide-angle means that the water is spread over a much wider area, lowering the pressure. A low angle means that the water that comes out of the nozzle close together like a small beam. Giving maximum output power on a small area. This article will show you how to make your pressure washer and power washer more powerful. For some models, you can change the unloader valve. And if you own a gas pressure washer, you can optimize your gas engine to increase the output pressure. How can I make my pressure washer more powerful? In general, there are four ways to make a pressure washer more powerful. Using a different nozzle, changing the pressure regulator or unloader valve, using a different gas type, or tweaking the engine. ● Changing the nozzle to make a pressure washer more powerful A pressure washer can be made more powerful by using the correct nozzle. Nozzles determine the angle of the water stream. A wide-angle means that the water is spread over a wider area but has lower pressure. A low angle gives a small spread with a higher pressure. If you want the highest output pressure, use the red 0-degree nozzle. There are 5 main pressure washer nozzles, each with their own color: - Red 0-degree nozzle: A nozzle with a red tip represents the narrowest angle which is 0 degrees. This nozzle creates a water stream with the highest pressure. A red-tip nozzle can do a lot of damage and must be used with care. Do not use the red-tip nozzle close on any surface. - Yellow 15-degree nozzle: The yellow tip nozzle creates a water stream at an angle of 15 degrees. Use this nozzle for cleaning concrete surfaces. - Green 25-degree nozzle: Green tip nozzles spray water at the surface at an angle of 25 degrees. Use this nozzle to pressure wash your car, clean mildew accumulated on patios or decks, or other household pressure washing jobs. - White 40-degree nozzle: A Whitetip nozzle is used to clean windows or sidings with minimal dirt. It produces a water spray of 40 degrees. It is the most user-friendly nozzle and causes less damage. - Black 65-degree nozzle: Blacktip nozzles produce a water stream with a 65-degree angle. It is the nozzle with the lowest pressure and does not remove tough stains. It is more used to wet a surface. The pressure washer regulator or unloader valve is what regulates the output pressure in your pressure washer. An unloader valve has a tension spring that can be set to get the maximum output pressure. Remark: The pressure regulator or unloader valve is also a safety feature. It ensures that the pressure can not exceed a certain level. Only adjust it when you know what you are doing. Or consult a professional. Changing the pressure regulator or unloader valve differs from a pressure washer to pressure washer. We will show you a more generic step-by-step method. But this can vary for your particular machine. Check the manufacturers manual for more details: - Step 1: Start the engine Start the engine if you have a gas pressure washer. Ensure that the engine is running fine. For an electric pressure washer, put the power cable in the mains. And turn it on. - Step 2: Use a red 0-degree nozzle Change the nozzle to a red 0-degree nozzle. This is the nozzle that gives the most powerful result. Locate the unloader valve. Open the unloader valve by removing the nut at the top. It is often a nylock nut to keep it from accidental loosening. Remove the black plastic pressure adjusting knob. The color and exact method can differ slightly for your model. After removing the washer and the spring, you should see the top of a threaded piston rod with two locking nuts. - Step 4: Increase the pressure The next step is to lock the two nuts together with a wrench. Leave a few threads free at the bottom. Now put back the nut and the adjusting knob back. Use the trigger until you see only water coming out. This way, all air is removed from the pump. Now use the trigger and check the pressure of the water. If your machine has a pressure gauge, you can use this to check the actual pressure. If you have a separate one, add it in between the spray hose and your machine. If you do not have a gauge, you have to do it visually. This is not easy, and I would not recommend it. Try to judge if the pressure is increasing or not. To increase the pressure, pull the trigger and tighten down the spring. If you reach the maximum set by the two nuts, and the pressure is still not ok. Please change the setting of the two nuts to give it some more room. If you notice that the pressure does not increase, it means you have reached the maximum pressure that the engine and pump can give. Try to find this maximum. At this level, the two nuts should be against the bottom, without any thread visible. If you do not adjust the two nuts correctly, it can mean that you will see a high spike pressure when you let the trigger go. This is not good for your machine. If you notice a big spike, over 10%, it could damage your pump. In this case, you have to set the two nuts lower. - Step 5: Check if all works fine Check if all works fine and with a higher pressure. - Step 6: Check the two nuts If all is fine, tighten the top of the two nuts. So they will not accidentally move. The pressure washer is now set to maximum pressure. ● Use a different fuel to make a pressure washer mower powerful Fill the gas tank on your pressure washer with a higher octane gas. In most pressure washers 87 octane gas is used. This is more economical than using 92 octane gas. But the higher octane gas burns quicker and increases the engine power. ● Tweak the engine to make a pressure washer mower powerful If you have an electric pressure washer, there is not much you can tweak. But in case you have a gas pressure washer. You can tweak your engine to give it more power. Small engines like your pressure washer need three things: air, fuel, and a good spark. If you do not do regular maintenance, it can mean that your engine is not performing optimally. Checking and cleaning can lead to a nice improvement. - Check the air filter, sparkplug, and oil The first step is to ensure that you have a clean air filter. This should be part of your regular maintenance. Check the filter, and clean it if needed. Paper air filters have to be replaced. Most other types of filters can be cleaned. First, tap it so the biggest dirt will fall off. Carefully clean it further with a vacuum. Some air filters can also be washed. Check the sparkplug. If it is dirty, clean it. If that does not help, replace it. The last thing you should check is the oil. If you did not change it recently, check the color. If it does not look ok, change the oil. And do not forget the oil filter. To ensure that you keep the engine in optimal order, ensure that you give it regular maintenance.
